Product Introduction

Amrta patented air handling unit structure with tenon and double pillar is our new most innovative air handling unit(AHU) product that is specially designed as a solution to overcome various kind of AHU weakness in the market. All metal elements in the cabinet are isolated by the PU foaming and the new designed rubber rib seal whose function is to eliminate thermal bridge. The structural and inner outer plate with the high density polyurethane foam form an entirety, the two structural have tightened together by bolts&nuts fastening and then sealed up with a rubber seal, had given a good air leakage solution of the unit,air leakage only 0.16%. The panel side frame patented design structure,connected by ten non and double pillar which ensure the support strength of the cabinet.

Amrta patented frame air handling unit possess complete function and has easy and flexible sections combination, air volume range from 1000~300000m³/h. It is widely applied in hotel, stadium,exhibition hall,office,metro,air port and etc.It can also be specially designed for medicine, electronic,textile, tobacco,and food industry and chemicals application project.

A=25mm

B=35mm

C=50mm

Left / Right Model Determination

Face the air intake opening, if the pipe connection and service panel are on the left side, the unit will be considered as left connection,and vice versa.

Product Features

Patented Structure, Excellent Quality

- Patented tennon and double pillar, PU foam, rubber rib steal isolate outer metal, which could prevent thermal bridge and provide low air leakage.
- Unit is assembled by panel directly, panel frame is patent design and inner stuff is PU foaming (density:50kg/m³), ensure the strength of panel.
- Every function section has service door, do ensure the positive and negative pressure section is without thermal bridge and leakage.

Aesthetic Outlook, Fashion Design

- Unit panel uses high strength pre-painted steel as its external skin. The pre-painted steel has an antirust properties and is covered with a protection plastic layer to prevent any scratches during assemble and transportation. After the panel is constructed, the corner becomes an arc structure thus providing an aesthetic outlook.

Easy Installation

- Amrta air handling unit is standard module design, its width module and height module could be enlarged in scale,in order to meet different requirement at site.
- All panel can be assembled or dismantled at site. Frequently assembled or dismantled would not affect the tightness and intensity. Assembled or disassembled unit is for your choice when delivery.

Professional Selection Software

- Professional selection software
- Graphic interface, easy operation
- Different equipment is optional according to customer's requirement
- Auto output performance diagram
- Confirm spare parts list, calculate the unit's price autonomic
- Output outlook diagram,design diagram and technic instruction

Air Volume Table

Note:

1. Chilled water inlet/outlet temperature 7/12°C.
2. Return air condition:inlet air 27°C DB/19.5°C WB, fresh air condition: inlet air 35°C DB/28°C WB.
3. The above data only for reference, if any change of working condition or different coil circuit lead to different cooling capacity, please refer to Amrta for the detail.
4. All specifications ore subject to change by the manufacture without prior notice.

Note:

- Hot water inlet/outlet 60°C/50°C.
- Air return temperature inlet 15°C DB, fresh air temperature inlet 7°C DB.
- The above data only for reference, if any changes of air intake conditions water inlet/outlet temperature lead to different heating capacity, please refer to Amrta for the detail.
- All specifications are subject to change by the manufacture without prior notice.

Note:

- Mixing box section and supply air section is of standard dimension. The position and dimension of the opening can be considered basing on the situation.
- The length of the humidifier section can be adjusted based on the requirement condition and method.
- Wet film humidifier is installed behind the cooling coil without individual section, if the humidifier installed in individual section, it requires 6 modules spaces.
- In front of the filter section, cooling section/heating section, silencer section an empty section is required for maintenance and serving purpose.
- The data above is just for your reference, it may vary based on the actual design.
- Any special request for the function sections, please contact Amrta.

Functional Section Instruction

● **Casing**

Amrta patented frame modular air handling unit panels after constructed becomes unit's external frame structure, else the cabinet jointed steel bar will become the internal frame. The internal and external framing system proved efficient in providing the support strength of the cabinet. Panels are assembled using direct structure assemble with bolt & nut fastening thus becoming a framing cabinet structure after assembly. Panel side frame is also a patented design and made of high tensile strength aluminum alloy structure profile, outer skin is of color bond steel while the inner skin is of zinc-coated galvanized steel. By applying the high density fire resistance polyurethane foaming with antitrust and heat insulation properties to all the panels, the panels will not be easily deformed under high pressure condition due to high panel strength. There are three different panel's thickness (25mm, 35mm, 50mm) for customer to choose from.

● **Mixing Box**

The mixing box section functions as a mixing compartment for the return air and fresh air. The inlet position and dimension of the fresh and return air can be adjusted according to customer requirement. The ratio of the fresh and return air can be altered by the air intake damper.

● **Air Damper**

By adjusting the damper, the best conditioning design can be achieved with an optimum fresh/return air ratio. The new damper is our patent design (patent Number:ZL982 45970.X) which is a gear type open structural. Aerodynamic aluminum alloy blades effectively reduce the noise level and air flow resistance. Electrical motor control is optional.

● **Filter**

Air filter area, quality, filtration efficiency, mechanical specification, anti-electrostatic, moisture absorption, fire resistance and filtration efficiency are according to the GB/T14295-93; the average air intake will be more than 80%.

Filter will be installed along the skid way or frame's channel. Service panel is provided for easy filter servicing.

- Primary filter - panel type (optional for bag type)
- Secondary filter - bag type
- Intermediate, high efficiency filter HEPA type filter

Activated carbon filter is made of organic carbon fiber which is use for odor elimination and air pollution prevention. In front and rear of the carbon filter require a standard filter installation. Automatic self cleaning high efficiency filter mainly used in the duct conditioning production zone, such as tobacco factory's cigarette packaging area. Cylinder type filter uses reversed compressed air to self cleaning, when the cylinder's dust increases and the pressure differential reaches the setting pressure value, the differential pressure controller will send the signal to activate the compressed air to blow out the cylinder dust.

Functional Section Instruction

	12"*24"	9	6	7	11		5	7	12	8	13	9	
	20"*24"												

Note:

1. The above chart only can apply for panel type, bag type and folded type air filter;
2. For nominal dimension 24"*24", 12"*24", 20"*24", 20"*20" panel filter, the actual dimension is (length*width*thickness, mm) 592*592*46, 287*592*46, 490*592*46,490*490*46;
3. For nominal dimension 24"*24", 12"*24", 20"*24", 20"*20" bag filter, the actual dimension is (length*width*thickness, mm) 592*592*381, 287*592*381,490*592*381,490*490*381;
4. For nominal dimension 24"*24", 12"*24", 20"*24", 20"*20" folded filter, the actual dimension is (length*width*thickness, mm) 592*592*292, 287*592*292, 490*592*292, 490*490*292.

● **Coil Section(cooling and heating)**

Cooling coil and heating coil are manufactured by copper tube and aluminum fin after pressure bonded to the tubes under a 12MPa pressure expansion as to ensure the bond contact is tight, even and without water leakage risky. Aluminum fins is 10-14 fpi. Seamless steel header is equipped with an access valve (air vent) on top and a drainage vent on the bottom. All pipes are according to the standard design specification, supply/return water pipe and drain pipe are constructed on the same side for easier pipe connection. Different type of moisture eliminators material is available for installation according to customer need. They are being used to remove water droplets which might be entrained in the air stream (moisture less than 0.4 kg /kg dry air) and can also control the stirring airflow. Drain pan is fabricated in galvanized steel and powder coated plus insulated with a layer of insulation to prevent condensation. The drain pan is being constructed to have a full width and slope drain pan with a flow guide slot to ensure smooth condensate drainage. The drain pipe is welded at the lowest possible position of the drain pan to effectively drain out the condensation water

Optional:

- 1)Can be copper fin or hydrophilic aluminum fin.
- 2)Stainless steel option for end plate and drain pan material.
- 3)Stainless steel or copper tube option for supply and return water pipe.
- 4)There are various combinations such as steel pipe with steel fin, stainless steel pipe with stainless steel fin, stainless steel pipe with aluminum fin, steel pipe with aluminum fin for customer to choose from according to their needs. Standard fin coil is corrugated structure).

Coil Inlet and Outlet Dimension

Note:

Above data is just for your reference. If there is change of the water pipe dia., the location of pipe and its size will change. For more detail data please contact Amrta.

Functional Section Instruction

• Spraying Section

Spraying could process various of air handling. Not only can realize to reduce enthalpy, dehumidification and cooling, but also can increase the enthalpy, humidification and heating. It could also form a nappe on the way of air flowing, purify and clean the air. One row, two rows and three rows is for your determination.

• Humidifier

Available type of humidification:

Method	Isothermal Humidify			Isoenthalpy Humidify	
	Dry Steam Humidify	Electrode Humidify	Electrical Heater Humidify	Highpressure Spray Humidify	Wet Film Humidify
Type	Direct Steam Supply	To have steam by current heating	To have steam by heating pipe	Increase water pressure to Jet water into air by nozzle to exchange the heat and humidity	Wet the wet film, when the air through it, gasify the water to humidify air.
Theory	Direct Steam Supply	To have steam by current heating	To have steam by heating pipe	Increase water pressure to Jet water into air by nozzle to exchange the heat and humidity	Wet the wet film, when the air through it, gasify the water to humidify air.
Requirement	Steam Pressure $\leq 0.4\text{MPa}$	Water Quality: clean city water or soft water	Water Quality: clean city water or other similar water	Water Quality: clean city water or other similar water	Water Quality: clean city water or other similar water
Range	Clean room A/C system	All kind of A/C system	All kind of A/C system	All kind of A/C system	Not for clean room A/C system

• Silencer

Silencer section is always in the front of the supply air section or return air section, to reduce the noise.

It is resistive silencer, which uses sound-absorbing material to reduce the noise. The material adopts hyperfine glass fibre whose feature obvious is high level fire proof, antirust, moisture proof. The silencer has obvious effect for medium and high frequency noise it is specially for air conditioner application.

Silencer's noise level reduction

Silencer	Section Length	Sound Range Frequency with Noise Level Reduction (dB)							
		63	125	250	500	1000	2000	4000	8000
1 Row	900	8	14	18	21	22	20	16	12
2 Rows	1500	10	17	25	28	31	28	24	18

• Electronic Air Cleaner Section

Adopt electrostatic precipitation technology, ionize suspended particle with positive electricity, and it will be caught by collected plate, to reach clear it in high efficiency. High static voltage can kill the bacterium, virus, dust mite and biological nucleus etc. At the same time it will be burned and collected by plate, sterilization rate can be more than 99%. Completely avoid bacteria, virus to breed and spread.

Functional Section Instruction

• Ultraviolet Sterilization Section

Ultraviolet sterilization is to break up the DNA of microorganism (deoxyribonucleic acid) by ultraviolet rays, it can kill the bacterium immediately or make them lose the ability of breeding. As UVC could be easily absorbed by DNA (about 253.7nm UVC is the best). Ultraviolet sterilization belongs to physical method which owns advantages such as simple, high efficiency, no second pollution, convenience management and automatic.

• Photocatalyst Section

Photocatalyst is also called photocatalytic oxidation reaction. It uses semiconductor material TiO_2 as catalyst, ultraviolet as its light source. It could produce active oxygen and hydroxyl radical which have strong oxidizing property. Then oxygen and hydroxyl radical could break formaldehyde, methylamine, xylol, TVOC and so on into CO_2 and H_2O , so that air is cleaned while destructive organ is eliminated.

• Trioxygen Section

Air or oxygen is used as raw material under high frequency and high voltage to release ozone, which is a strong oxidizing agent with very active chemical properties. Ozone can not only oxidize the enzyme needed by bacteria in creating glucose, but also can directly damage cells, DNA and RNA of bacteria and virus, as well as their metabolism. Besides, it can enter their cells through cell membrane and kill bacteria with permeability aberration by working on lipoprotein of the outer LPS on the outer membrane. No virulence will be left as second pollution, so it is praised as "the cleanest oxidant and sterilant". Ozone generator is always installed at air discharge section.

• Rotary Dehumidifier

High efficient rotary dehumidifier transfer humidity of wet air to the wheel and then transport to the recycle area where H_2O is gasified under high temperature heating and discharged to outside by recycle fan. Wheel is rotating 12 to 24 round per hour without stop, while handling (dehumidifying), and recycling (drying) air. Recycled air heating can use electric heater or steam heater, decided by customer. Rotary dehumidifier has large range of use, can operate with high efficient in low temperature condition, also, it can handle 100%RH wet air wheel is cleanable, with long useful life, easy to operate with stable performance. It can be widely used in low temperature low humidity industry area such as spaceflight, aviation, military, electronics, pharma, chemical fiber, film prints, bank vault, wood seasoning printing, food, cigarette, personal protection, underground switching room etc.

• Heat Recovery

Thermal wheel recovery system shall not only recover the sensible heat of the unit but it also recovers the latent heat of the unit. Exhaust and fresh air heat exchange take place inside the moving wheels. The recovery efficiency is around 60-90%. Medium recovery system utilizes the refrigerant and hot air to flow through the thermal wheel in opposite direction and the heat exchanging process takes place. After that this hot fluid is flowing through to the heat exchanger which needed to heat up. After releasing the heat in the heat exchanger, the refrigerant will return back to the thermal wheel. If only recovering sensible heat, water circulating pump is needed. Normally the refrigerant medium is either water or ethanol. Optional recovery system: tube type heat recovery or plate heat exchanger recovery.

Heat Wheel Performance(Low Density)

Note:

- 1.Efficiency in above table is sensible efficiency, based on 23°C air discharge temperature.
- 2.Total heat efficiency= sensible efficiency*correction factor(find the correction factor in according table).

Note:

1. Efficiency in above table is sensible efficiency, based on 23°C air discharge temperature.
2. Total heat efficiency= sensible efficiency*correction factor(find the correction factor in according table).

Efficiency Correction(Standard Density)

Note:

1. Efficiency in above table is sensible efficiency, based on 23°C air discharge temperature.
2. Total heat efficiency= sensible efficiency*correction factor(find the correction factor in according table).

Functional Section Instruction

● **Electrical Heater**

Electrical heater applies PTC heating elements, no fire, safety and reliable. Electrical heater elements can install onto the zinc galvanized steel frame. Power supply 380V or 220V (depends on user requirement). It can split into one or multiple connection to fulfill different heater power control requirements. Electrical heater cable can be extended to the unit cabinet external control box. Main control box is provided by user.

Functional Section Instruction

• Electrical Heater

Utilization of fan selection computer program to determine the fan motor, in order to fulfill the air volume and static requirement. Fan motor can either centrifugal fan forward curved, backward curved blades or aerofoil blades. All the housing and support is made of alloy zinc coated steel, blower wheel is all under stringent inspection for a dynamic and static balancing. Anti-electrostatic belt is selected by factory to drive the pulley.

Motor is of TEFC type, 380V/50Hz voltage and installed on an adjustable rail track for belt tightening adjustment. Blower and fan motor are mounted on the same base.

The base is constructed on the cabinet with a spring isolator. Blower discharge is connected to the fan cabinet using flexible fire retardant duct connector to further reduce the vibration and noise level.

• Fan Blower, Air Discharge Direction

Classical Combination

- A:Mixing Box
- B:Primary Filter
- C:Cooling Coil
- D:Fan Section
- E:Heater Section
- F:Humidifier Section
- G:Scattering Section
- H:Secondary Filter
- I:Supply Air Fan
- J:Access Section
- K:Heat Recovery Wheel Section
- L:Fresh Air Section
- M:Air Discharge Fan Section
- N:Return Air Section
- O:Plate Heat Recovery
- P:Rotary Dehumidifier
- Q:Pre-cooling Section

Note:
Above function section is only for your reference, it can be adjusted according to actual condition.

Unit Installation

- Ensure the unit installation base ground is leveled.
- Leave sufficient space around the unit especially for piping installation and servicing panel side.(Proposed not less than 1m),for daily maintenance application.
- To avoid air leak from condensation drain pipe, a U-trap must be applied before connecting with the external installed pipe.
- Please connect the piping according to the factory operation guide label of the unit. During connection,apply an even force and not exceed force to avoid damage done to the internal structure of the unit.
- Standard power supply is 380V/50Hz three phases with four wire.Before connecting to the input power supply,make sure the supply voltage fulfill the label requirement.No phase shortage and unstable supply voltage allowed. Check whether the blowing wheel is rotating in the correct direction.
- All the motors should be equipped with an overload protector.
- Flexible connector should be applied on the external duct and water pipe connection to avoid any vibration transmission.

$H = \text{Internal Pressure}(\text{mm H}_2\text{O}) + 20$

Note: Unit internal pressure is coil pressure load

Wiring Diagram

Electric Heater Wiring

The electrical heater provided as a frame structural, complete internal wiring and with standby power supply socket that according to the unit label instruction. For electrical heater control wiring, please refer to below diagram.

SB2- Start Button; KA-Intermediate Relay; KM1-Fan Motor Contactor; KM2-Electrical Contactor TH-Electric Heater Protector; FH-Fire proof valve; KT1- On Delay Time Relay; KT2- Off Delay Time Relay QF-Low Voltage Circuit Breaker; SA-Modes Switch(Open-Fan; Close-heater).

During power on, the on delay timer relay set as minimum 30 seconds, else the off delay timer set as minimum 180 seconds.

Warning: Electrical heater thermostat must connect with the blower motor and electrical heater interlocking control circuit, no circuit is allowed. After fan motor operating normally, then the electrical heater will be activated. When the unit stops, electrical heater cut off first for 3 minutes, then the blower motor will stop.

In the control design, the humidifier and other components' wiring diagram will refer to unit wiring diagram. Take attention: Humidifier and other components must interlock with fan motor. When the motor starts, then the humidifier can be activated; else after cut off the humidifier then can stop the fan motor; If the unit's air discharge outlet and air duct are provided with electrical air damper, the air damper must cut in first before the motor operating. Else, the motor stop operating, then the air damper can close. It will ensure when the fan blower operates, the air damper of the duct is under normal condition.

Warning: All electrical components must comply with the safety grounding, no neutral grounding is allowed. Wrong wiring will lead to explosion, fire and body injury!

Warning: Must ensure the steam coil will close the steam valve before the fan blower stop operating!

Operation & Maintenance

- Before the unit operation, check the water pipe valves system and duct equipment. Make sure everything is under good condition.
- Check the fan motor and blower moving parts regularly for their connection, operation and rotating direction. Readjust it if necessary.
- Washable primary filter should be washed either by clean water or detergent according to surrounding environment's cleanliness level.
- Secondary filter should be changed or washed when the air flow resistance becomes double of that at the initial stage.
- During winter, coil water should be drained out if not operating. If the unit needs to operate during winter time, make sure when the unit stops running, the coil water must circle the system and the fresh air damper must be closed to prevent coil freezing. If the unit stops operation for a long duration, coil water must be drained out.
- Clean soft water must be used for chilled water and hot water system. Every two years, water chemical treatment must be performed to eliminate the contamination in the system and apply compressed air or water for cleaning the fin coil surface.

For more detail about installation,operation,maintenance and etc,please refer to the product catalogue.
